

Theory review of Lepton Flavour Violation

Paride Paradisi

University of Padova and INFN

Workshop on Muon Precision Physics,
Liverpool, 10th November 2023

- 1 **Strategies to look for New Physics at low-energy**
- 2 **Current status of LFV**
- 3 **EDMs, $g-2$ and cLFV interrelationship**
- 4 **Conclusions and future prospects**

Where to look for New Physics at low-energy?

- **Processes very suppressed or even forbidden in the SM**

- ▶ LFV processes ($\mu \rightarrow e\gamma$, $\mu \rightarrow e$ in N, $\tau \rightarrow \mu\gamma$, $\tau \rightarrow 3\mu$, ...)
- ▶ CPV effects in the leptonic (e , μ) and neutron EDMs
- ▶ FCNC & CPV in $B_{s,d}$ & D decay/mixing amplitudes

- **Processes predicted with high precision in the SM**

- ▶ EWPO as $(g-2)_\mu$: $\Delta a_\mu = a_\mu^{\text{exp}} - a_\mu^{\text{SM}} = (2.51 \pm 0.59) \times 10^{-9}$ (4.2σ discrepancy!)
- ▶ LFUV in $M \rightarrow \ell\nu$ (with $M = \pi, K, B$), $B \rightarrow D^{(*)}\ell\nu$, $B \rightarrow K\ell\ell'$, τ and Z decays

- **High-intensity frontier: A collective effort to determine the NP symmetries**

- **High-energy frontier: A unique effort to determine the NP scale**

Where to look for New Physics at low-energy?

- Processes very **suppressed** or even **forbidden** in the SM
- Processes predicted with **high precision** in the SM

High-intensity frontier: A collective effort to determine the NP dynamics

Experimental status

Process	Present	Experiment	Future	Experiment
$\mu \rightarrow e\gamma$	4.2×10^{-13}	MEG	$\approx 6 \times 10^{-14}$	MEG II
$\mu \rightarrow 3e$	1.0×10^{-12}	SINDRUM	$\approx 10^{-16}$	Mu3e
$\mu^- \text{ Au} \rightarrow e^- \text{ Au}$	7.0×10^{-13}	SINDRUM II	?	
$\mu^- \text{ Ti} \rightarrow e^- \text{ Ti}$	4.3×10^{-12}	SINDRUM II	?	
$\mu^- \text{ Al} \rightarrow e^- \text{ Al}$	—		$\approx 10^{-16}$	COMET, MU2e
$\tau \rightarrow e\gamma$	3.3×10^{-8}	Belle & BaBar	$\sim 10^{-9}$	Belle II
$\tau \rightarrow \mu\gamma$	4.4×10^{-8}	Belle & BaBar	$\sim 10^{-9}$	Belle II
$\tau \rightarrow 3e$	2.7×10^{-8}	Belle & BaBar	$\sim 10^{-10}$	Belle II
$\tau \rightarrow 3\mu$	2.1×10^{-8}	Belle & BaBar	$\sim 10^{-10}$	Belle II
$d_e(\text{e cm})$	1.1×10^{-29}	ACME	$\sim 3 \times 10^{-31}$	ACME III
$d_\mu(\text{e cm})$	1.8×10^{-19}	Muon (g-2)	$\sim 10^{-22}$	PSI

Table: Present and future experimental sensitivities for relevant low-energy observables.

- So far, only upper bounds. Still excellent prospects for exp. improvements.
- We can expect a NP signal in all above observables below the current bounds.

- GIM mechanism very effective in LFV transitions
- amplitude proportional to $A(\mu \rightarrow e\gamma) \propto m_\nu^2$

Very small !!!

$$\text{BR}(\mu \rightarrow e\gamma) \simeq \frac{\Gamma(\mu \rightarrow e\gamma)}{\Gamma(\mu \rightarrow e\nu\bar{\nu})} = \frac{3\alpha}{32\pi} \left| \sum_{k=1,3} \frac{U_{\mu k} U_{ek}^* m_{\nu_k}^2}{M_W^2} \right|^2.$$

$$\text{BR}(\mu \rightarrow e\gamma) = 10^{-55} \div 10^{-54}$$

- similar suppressions for $\mu \rightarrow 3e, \tau \rightarrow 3\mu, \mu \rightarrow e, \dots$

Why flavor violation is visible in neutrino oscillation while it's not in charged LFV?
 The uncertainty principle sets the oscillation time for $\mu \rightarrow e\gamma$ to be $t \sim h/M_W!$

Why do we need New Physics (NP)?

- **Gravity** $\implies \Lambda_{\text{Planck}} \sim 10^{18-19} \text{ GeV}$
- **Neutrino masses** $\implies \Lambda_{\text{see-saw}} \lesssim 10^{15} \text{ GeV}$
- **BAU**: evidence of CPV beyond SM
 - ▶ Electroweak Baryogenesis $\implies \Lambda_{\text{NP}} \lesssim \text{TeV}$
 - ▶ Leptogenesis $\implies \Lambda_{\text{see-saw}} \lesssim 10^{15} \text{ GeV}$
- **Dark Matter (WIMP)** $\implies \Lambda_{\text{NP}} \lesssim \text{TeV}$
- **Hierarchy problem**: $\implies \Lambda_{\text{NP}} \lesssim \text{TeV}$

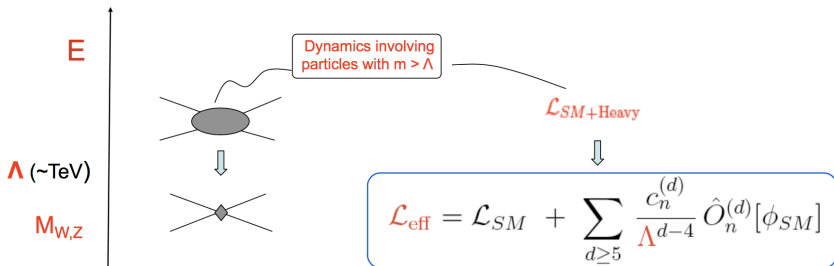

SM = effective theory at the EW scale

$$\mathcal{L}_{\text{eff}} = \mathcal{L}_{\text{SM}} + \sum_{d \geq 5} \frac{C_{ij}^{(d)}}{\Lambda_{\text{NP}}^{d-4}} O_{ij}^{(d)}$$

- $\mathcal{L}_{\text{eff}}^{d=5} = \frac{y_{\nu}^{ij}}{\Lambda_{\text{see-saw}}} L_i L_j \phi \phi$,
- $\mathcal{L}_{\text{eff}}^{d=6}$ generates FCNC operators

- Dynamics below the scale Λ [\sim mass of new particles] is described by \mathcal{L}_{eff}

- \mathcal{L}_{eff} is built out of relevant low-energy degrees of freedom (SM fields)
 - \mathcal{L}_{eff} respects the SM gauge symmetries $G_{SM} = SU(3)_c \otimes SU(2)_L \otimes U(1)_Y$
 - \mathcal{L}_{eff} is organized in inverse powers of Λ (amplitudes suppressed by powers of E/Λ)
- Experiments at the precision frontier probe energy scale Λ and symmetries of the new interactions (coeff. & structure of $\hat{O}_n^{(d)}$)

Complete list of dim-6 LFV operators

4-leptons operators		Dipole operators

Lepton-Higgs operators			
$Q_{\Phi\ell}^{(1)}$	$(\Phi^\dagger i \overleftrightarrow{D}_\mu \Phi)(\bar{L}_L\gamma^\mu L_L)$	$Q_{\Phi\ell}^{(3)}$	$(\Phi^\dagger i \overleftrightarrow{D}_\mu^I \Phi)(\bar{L}_L\tau_I\gamma^\mu L_L)$
$Q_{\Phi e}$	$(\Phi^\dagger i \overleftrightarrow{D}_\mu \Phi)(\bar{e}_R\gamma^\mu e_R)$	$Q_{e\Phi 3}$	$(\bar{L}_L e_R \Phi)(\Phi^\dagger \Phi)$

$$\mu \rightarrow e\gamma \quad \mu \rightarrow 3e \quad \mu \rightarrow e$$

[Physics Briefing Book, 1910.11775]

Probing NP in the leptonic sector

New Physics for the muon $g - 2$: at which scale?

- Δa_μ discrepancy at $\sim 4.2 \sigma$ level:

$$\Delta a_\mu = a_\mu^{\text{EXP}} - a_\mu^{\text{SM}} \equiv a_\mu^{\text{NP}} = (2.51 \pm 0.59) \times 10^{-9}$$

$$\Delta a_\mu \equiv a_\mu^{\text{NP}} \approx (a_\mu^{\text{SM}})_{\text{weak}} \approx \frac{m_\mu^2}{16\pi^2 v^2} \approx 2 \times 10^{-9}$$

- ▶ NP is at the weak scale ($\Lambda \approx v$) and weakly coupled to SM particles.*
- ▶ NP is very heavy ($\Lambda \gg v$) and strongly coupled to SM particles.
- ▶ NP is very light ($\Lambda \lesssim 1 \text{ GeV}$) and feebly coupled to SM particles.

*Favoured by the *hierarchy problem* and by a WIMP DM candidate but disfavoured by the LEP and LHC bounds (supersymmetry being the most prominent example).

- NP effects are encoded in the effective Lagrangian

$$\mathcal{L} = e \frac{m_\ell}{2} (\bar{\ell}_R \sigma_{\mu\nu} A_{\ell\ell'} \ell'_L + \bar{\ell}'_L \sigma_{\mu\nu} A_{\ell\ell'}^* \ell_R) F^{\mu\nu} \quad \ell, \ell' = e, \mu, \tau,$$

- ▶ Branching ratios of $\ell \rightarrow \ell' \gamma$

$$\frac{\text{BR}(\ell \rightarrow \ell' \gamma)}{\text{BR}(\ell \rightarrow \ell' \nu_\ell \bar{\nu}_{\ell'})} = \frac{48\pi^3 \alpha}{G_F^2} (|A_{\ell\ell'}|^2 + |A_{\ell'\ell}|^2).$$

- ▶ Δa_ℓ and leptonic EDMs

$$\Delta a_\ell = 2m_\ell^2 \text{Re}(A_{\ell\ell}), \quad \frac{d_\ell}{e} = m_\ell \text{Im}(A_{\ell\ell}).$$

- ▶ “Naive scaling”: a broad class of NP theories contributes to Δa_ℓ and d_ℓ as

$$\frac{\Delta a_\ell}{\Delta a_{\ell'}} = \frac{m_\ell^2}{m_{\ell'}^2}, \quad \frac{d_\ell}{d_{\ell'}} = \frac{m_\ell}{m_{\ell'}}.$$

- $\text{BR}(\ell_i \rightarrow \ell_j \gamma)$ vs. $(g - 2)_\mu$

$$\text{BR}(\mu \rightarrow e \gamma) \approx 3 \times 10^{-13} \left(\frac{\Delta a_\mu}{3 \times 10^{-9}} \right)^2 \left(\frac{\theta_{e\mu}}{10^{-5}} \right)^2$$

$$\text{BR}(\tau \rightarrow \mu \gamma) \approx 4 \times 10^{-8} \left(\frac{\Delta a_\mu}{3 \times 10^{-9}} \right)^2 \left(\frac{\theta_{\mu\tau}}{10^{-2}} \right)^2$$

- EDMs vs. $(g - 2)_\mu$

$$d_e \approx \left(\frac{\Delta a_\mu}{3 \times 10^{-9}} \right) 10^{-29} \left(\frac{\phi_e^{CPV}}{10^{-5}} \right) e \text{ cm},$$

$$d_\mu \approx \left(\frac{\Delta a_\mu}{3 \times 10^{-9}} \right) 2 \times 10^{-22} \phi_\mu^{CPV} e \text{ cm},$$

- **Main messages:**

- ▶ $\Delta a_\mu \approx (3 \pm 1) \times 10^{-9}$ requires a nearly flavor and CP conserving NP
- ▶ Large effects in the muon EDM $d_\mu \sim 10^{-22} e \text{ cm}$ are still allowed!

[Giudice, P.P., & Passera, '12]

Experimental status of the muon EDM

[Crivellin, Hoferichter & Schmidt-Wellenburg, '18]

$$d_\mu \leq 10^{-21} \text{ e cm} \left(\frac{d_e}{10^{-31} \text{ e cm}} \right)$$

$$d_\mu \simeq \left(\frac{\Delta a_\mu}{3 \times 10^{-9}} \right) 2 \times 10^{-22} \phi_\mu^{CPV} \text{ e cm},$$

[Giudice, PP & Passera, '12]

- **LFV operators @ dim-6**

$$\mathcal{L}_{\text{eff}} = \mathcal{L}_{\text{SM}} + \frac{1}{\Lambda_{\text{LFV}}^2} \mathcal{O}^{\text{dim-6}} + \dots$$

$$\mathcal{O}^{\text{dim-6}} \ni \bar{\mu}_R \sigma^{\mu\nu} H e_L F_{\mu\nu}, (\bar{\mu}_L \gamma^\mu e_L) (\bar{f}_L \gamma^\mu f_L), (\bar{\mu}_R e_L) (\bar{f}_R f_L), f = e, u, d$$

- $l \rightarrow l'\gamma$ probe ONLY the dipole-operator (at tree level)
- $l_i \rightarrow l_j \bar{l}_k l_k$ and $\mu \rightarrow e$ in Nuclei probe dipole and 4-fermion operators
- When the dipole-operator is dominant:

$$\text{BR}(l_i \rightarrow l_j l_k \bar{l}_k) \approx \alpha \times \text{BR}(l_i \rightarrow l_j \gamma)$$

$$\text{CR}(\mu \rightarrow e \text{ in N}) \approx \alpha \times \text{BR}(\mu \rightarrow e \gamma)$$

$$\frac{\text{BR}(\mu \rightarrow 3e)}{3 \times 10^{-15}} \approx \frac{\text{BR}(\mu \rightarrow e \gamma)}{5 \times 10^{-13}} \approx \frac{\text{CR}(\mu \rightarrow e \text{ in N})}{3 \times 10^{-15}}$$

- **Ratios like $Br(\mu \rightarrow e\gamma)/Br(\tau \rightarrow \mu\gamma)$ probe the NP flavor structure**
- **Ratios like $Br(\mu \rightarrow e\gamma)/Br(\mu \rightarrow eee)$ probe the NP operator at work**

- Longstanding muon $g - 2$ anomaly

$$\Delta a_\mu = a_\mu^{\text{EXP}} - a_\mu^{\text{SM}} \equiv a_\mu^{\text{NP}} = (2.51 \pm 0.59) \times 10^{-9}$$

$$\Delta a_\mu \equiv a_\mu^{\text{NP}} \approx (a_\mu^{\text{SM}})_{\text{weak}} \approx \frac{m_\mu^2}{16\pi^2 v^2} \approx 2 \times 10^{-9}$$

- Testing the muon $g - 2$ anomaly through the electron $g - 2$

$$\frac{\Delta a_e}{\Delta a_\mu} = \frac{m_e^2}{m_\mu^2} \iff \Delta a_e = \left(\frac{\Delta a_\mu}{3 \times 10^{-9}} \right) 0.7 \times 10^{-13}$$

- ▶ a_e has never played a role in testing NP effects. From $a_e^{\text{SM}}(\alpha) = a_e^{\text{EXP}}$, we extract α which was the most precise value of α up to 2018!
- ▶ The situation has now changed thanks to th. and exp. progresses.
- ▶ α can be extracted from atomic physics and a_e used to perform NP tests!

[Giudice, P.P. & Passera, '12]

- **Important questions in view of ongoing/future experiments are:**
 - ▶ What are the expected deviations from the SM predictions induced by TeV NP?
 - ▶ Which observables are not limited by theoretical uncertainties?
 - ▶ In which case we can expect a substantial improvement on the experimental side?
 - ▶ What will the measurements teach us if deviations from the SM are [not] seen?
- **(Personal) answers:**
 - ▶ We can expect any deviation from the SM expectations below the current bounds.
 - ▶ LFV processes, leptonic EDMs and LFUV observables do not suffer from theoretical limitations and there are still excellent prospects for experimental improvements.
 - ▶ If the muon $g - 2$ anomaly will survive, we expect relevant enhancements in leptonic EDMs (especially in the muon EDM) and LFV decays $\mu \rightarrow e\gamma$, $\mu \rightarrow eee$,
 - ▶ Testing New Physics effects in the electron $g - 2$ at the 10^{-13} is not too far! This will bring a_e to play a pivotal role in probing New Physics in the leptonic sector.

Message: an exciting Physics program is in progress at the Intensity Frontier!
